## TABLE OF CONTENTS

## ATTACHMENTS

**Name:** USCG LORAN-C Station Historic District, Shoal Cove

**Location:** Shoal Cove, Alaska

**Present Owner:** U.S. Forest Service (USFS)

A Memorandum of Understanding (MOU) was issued in 1976 by the USFS that allowed the U.S. Coast Guard (USCG) to build the Long Range Aid to Navigation (LORAN)-C station at Shoal Cove and use approximately 279 acres of adjacent lands throughout the Tongass National Forest indefinitely. According to the MOU, upon decommissioning of the LORAN station, the agreement was replaced with a communications lease to the USCG for a term of thirty years.

**Present Use:** Temporary logging operations are underway at Shoal Cove and there is a floating logging camp nearby. The surrounding area is also used by private outfitters and guides recreationally; there is one public recreation cabin (Fish Creek Public Recreation Cabin) in the vicinity.

**Significance** Long Range Aid to Navigation (LORAN) was a government-provided terrestrial navigation system established for military and civilian users throughout the United States, Canada, Europe, Asia, and Russia. Since its inception in 1940, LORAN provided marine, air, and land positions to users during World War II (WWII), through the Cold War and into the twenty-first century. LORAN-C, a later version of the long-range navigation series, operated as a low frequency hyperbolic navigation system using the time difference in pulses from three or more transmitting stations to obtain a position. It was highly accurate, all-weather, and available twenty-four hours a day. In 2010, the United States and Canada both ceased operation of the system.

The LORAN-C station at Shoal Cove was established in 1975 by USCG. Among other buildings, the station consists of an Administration and Barracks Building and four 695′ guyed towers. It is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation that represents the federal government’s growing involvement and responsibility for safe navigation. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.

The navigation towers (demolished September/October 2010) and all buildings associated with the operation of LORAN-C are considered contributing elements to the district.

**Historian:** Terri Asendorf, Architectural Historian, MSHP, Jacobs Engineering Group Inc.

**Project Information:** The USCG LORAN-C Station Historic District, Shoal Cove, Alaska, recording project was performed under contract with the U.S. Army Corps of Engineers (USACE) for the USCG under the direction of the Alaska State Historic Preservation Officer and the Advisory Council on Historic Preservation. The historical reports and photographs were prepared by Jacobs. Terri Asendorf served as architectural historian, and Casey Martin served as architect.

# I. Historical Information

## I.a. Physical History

### *I.a.i. Date of Erection*

1975

### *I.a.ii. Architect*

Leo A. Daly Architecture and Engineering (Headquarters in Nebraska)

### *I.a.iii. Original and Subsequent Owners, Occupants, Uses*

USFS, USCG LORAN-C Station

### *I.a.iv. Builder, Contractor, Suppliers*

Four 695′ guyed antennas built by Stainless Inc., Model 2515 (SLT)

### *I.a.v. Original Plans and Construction*

These are discussed individually below and on the attached architectural building inventory forms. Site plans and architectural drawings of the facilities are also provided.

### *I.a.vi. Alterations and Additions*

These are discussed individually below and on the attached architectural building inventory forms. Site plans and architectural drawings of the facilities are also provided.

## I.b. Historical Context

### *I.b.i. LORAN-A to C*

Historically, maritime and aviation positioning was done using dead reckoning, celestial navigation, and later, radio beacon. With the approach of WWII, the development of a more accurate system was needed for defense operations, and in 1940, the Army Signal Corps issued a requirement for “Precision Navigational Equipment for Guiding Airplanes.” The pulsed, hyperbolic, long-range radio navigation system that eventually became known as LORAN was proposed by physicist Alfred L. Loomis working under the direction of the National Defense Research Committee (NDRC). In 1941, his proposal was accepted and trial stations were established at inactive USCG lifeboat stations at Montauk Point in Long Island, New York, and Fenwick Island, Delaware. Corporations such as RCA, Sperry, Bell Laboratories, Westinghouse, and General Electric filled equipment orders for the model stations (Pierce, McKenzie, and Woodward 1948).

LORAN was further developed by scientists at the Radiation Laboratory of the Massachusetts Institute of Technology. Generally derived from the British GEE (generalized estimating equation) system, the first iteration of LORAN operated at the 1,850 and 1,950 kilohertz (kHz) frequencies. Later called “LORAN-A,” its use by naval and air convoys in defense missions quickly increased due to requirements by the Allied forces for a means of a

tactical bombing system (Joint Aids to Navigation Panel 1957). Under the Lend-Lease program established in 1941, the United States used LORAN-A to guide planes and bombers to the former Soviet Union during the war (Thomas 2011).

Between 1942 and 1944, LORAN-A use rapidly increased, and by 1945, there were stations built all over the world providing some sixty million square miles of coverage (Pierce, McKenzie, and Woodward 1948). The stations were grouped into regional chains consisting of one “master” transmitting station and two or more “secondary” transmitting stations, each separated by several hundred miles. Station location and orientation were determined by coverage requirements. By 1944, approximately 75,000 receivers were distributed to military and civilian users with seventy-five U.S. and fifteen British and Canadian LORAN transmitters providing coverage over 30 percent of the earth’s surface (Pierce, McKenzie, and Woodward 1948), including high-traffic water and air routes.

Originally a U.S. Army-driven effort, the LORAN-A program was later transferred to the U.S. Navy because of its mission to precisely and safely route convoys and guide and deliver defense material – tasks which could be achieved using LORAN. In November 1941, the U.S. Treasury Department transferred the USCG to the U.S. Navy to support war efforts. Given its official role as operator and administrator of U.S. Aids to Navigation, the USCG assumed management of the LORAN program for the Navy. After the war, in 1946, the USCG was transferred back to the Treasury Department and retained management of the LORAN program (Thomas 2011). Incidentally, USCG was transferred to the Department of Transportation in 1967, and then again to the Department of Homeland Security in 2002.

In 1947, the International Telecommunications Union Conference (ITU) allocated the frequency band 90–110 kHz for the development of a farther-reaching, long distance, radio navigation system on a worldwide basis (Dickinson 1959). This was partly in response to a need for less signal interference:  the higher ranges were allocated solely for military use during wartime, but when they were returned to civilian use after the war, signal interference increased. Over the next decade, various military branches were attempting to improve LORAN including the U.S. Air Force (USAF), which developed the Cycle Matching Tactical Bombing and Navigation System (CYTAC). CYTAC was an experimental electronic strategic bombing system that used the same hyperbolic principles as LORAN-A, but at the lower frequencies allocated by the ITU. Since the tactical bombing application of CYTAC was classified, its use for civilian navigation was limited; therefore, USAF declassified the civilian application of CYTAC and named it “LORAN-C,” while the tactical bombing application remained confidential (Joint Aids to Navigation Panel 1957).

The first LORAN-C navigation system was installed on the U.S. East Coast in 1957 at stations in Carolina Beach, North Carolina, Martha's Vineyard, Massachusetts, and Jupiter Inlet, Florida.

In 1974, LORAN-C was authorized by the Secretary of Transportation to be the federally provided radio navigation system for the U.S. Coastal Confluence Zone (CCZ), which is defined as the area seaward of a harbor entrance to fifty nautical miles offshore, or the edge of the Continental Shelf, whichever is greater. This mandate drove the expansion of LORAN-C service to all coasts of the United States – including Alaskan waters and the Gulf of Mexico – and to the Great Lakes by 1980. LORAN-C also aided early environmental initiatives. In the 1970s, the system was used to guide oil tankers along the Pacific Coast from Alaska to Canada and the contiguous United States to assure high precision navigation and minimize potential collision-related damage from growing tanker traffic.

### *I.b.ii. LORSTA Shoal Cove*

LORAN station (LORSTA) Shoal Cove is located in the Tongass National Forest on Revillagigedo Island, approximately twenty miles northeast of Ketchikan. The Shoal Cove LORAN-C station was constructed in 1975 by the international architecture and engineering firm Leo A. Daly, which has been headquartered in Omaha, Nebraska since 1915 (www.leoadaly.com). It was a dual-rated, double secondary station that produced secondary signals for both the Gulf of Alaska Chain that encompassed Narrow Cape (Kodiak), Tok, and Port Clarence, and for the Canadian West Coast Chain that encompassed George, Port Hardy, and Williams Lake.

Crewmembers lived in Ketchikan while off duty and at the station while working. A contracted civilian boat made one-hour trips between Ketchikan and Shoal Cove three days a week. USCG Station Ketchikan served as the Base Support Unit for Shoal Cove, routinely providing the station with logistics and supplies. Ketchikan provided a community with governmental and social services, recreational facilities, and commercial businesses for the USCG crewmembers.

According to Electronic Technician Steven Worthington, who served at LORAN-C Shoal Cove in 2010, leisure time for many of the crew consisted of watching movies and television; playing ping-pong, pool, or video games; and sometimes bicycling, hunting, or fishing. Occasionally, Hooverball, hacky sack, and basketball tournaments would be organized. In Ketchikan, volleyball tournaments were frequent during the summer months. According to Worthington, the town of Ketchikan was somewhat isolated during the winter months, when only a few restaurants, a grocery store, and a Wal-Mart remained open. The town depends upon summer tourism resulting in many businesses being closed from October to March.

### *I.b.iii. State of LORAN*

In 1993, as a response to the advent of Global Navigation Satellite Systems (GNSS), the Department of Defense advised that there was no longer a

requirement for LORAN. As a result, USCG attempted to close U.S. LORAN stations and returned operation of all international stations to the host countries. The Russian-American Chain that included Attu remained in operation as a gesture made by both countries to promote peace after the Cold War. Moreover, Congress did not allow for closure of U.S. stations based on the protests of civilian users, and the program continued in operation for another fourteen years (Thomas 2011).

In October 2009, in an overall effort to eliminate unnecessary federal programs, the U.S. Department of Homeland Security signed into law an act terminating the LORAN-C system. The USCG began a phased decommissioning of LORAN-C stations throughout the United States in February 2010 including demolishing transmission towers, which were an obstruction to air traffic, and placing all associated buildings in layaway. LORAN-C remains in use in several countries including the United Kingdom, France, Germany, Norway, Saudi Arabia, India, Korea, Japan, China, and Russia.

On August 3, the LORAN-C signal from LORSTA Shoal Cove was terminated. The Shoal Cove station was decommissioned and the towers razed in September/October 2010. By October 1, 2010, all LORAN systems ceased signal operation.

*Future of LORAN*

The termination of LORAN-C in the United States and Canada has incited speculation on the need for a backup navigation system should disruptions occur with GNSS. Enhanced LORAN, or eLORAN, is the latest iteration of LORAN technology, providing navigation services completely independent of GNSS. The eLORAN system has enhanced the LORAN-C signal by providing: (1) better control and tolerance of timing and pulse shape; (2) time-of-transmission synchronization to universal coordinated time (UTC) at each transmitter site independent of any changes in signal propagation; and (3) the addition of a digital data broadcast capability called the LORAN data channel that can be used to send time-synchronization and text messages.

Several European countries, including the United Kingdom, Saudi Arabia, and South Korea are converting former LORAN stations to eLORAN technology, while other countries, including Ireland and Sweden, are building new stations (Schue 2011). In North America, debate over which system should serve as backup for GNSS has prevented a transition from LORAN-C to eLORAN.

# II. Architectural Information

## II.a. Physical History of Buildings (USCG 2005)

### *II.a.i. Operations Building*

The Operations Building is a two-story, 18,365-square-foot building with an irregular massed plan and a flat roof. The building contains the generator room, transmitter room, operations room, barracks, offices, recreation area, galley, garage, and snow plenum. It was constructed in 1975 and underwent a minor renovation of the shower rooms in 1994 (USCG 2011b).

The foundation of the Operations Building consists of reinforced concrete with a spread footing foundation. The ground floors are concrete slab-on-grade. The walls are painted, textured, cast-in-place concrete. The upper floor consists of reinforced concrete beams supporting a concrete slab. Concrete bearing walls extend to the roof. Roof framing consists of open web steel joists supporting steel decks. At the generator and transmitter plenums, steel beams span between concrete bearing walls and directly support the steel deck.

The walls between the generator room and the garage bay, and at the entrance to the transmitter plenum, are concrete masonry unit (CMU), which are laterally supported at the roof with steel bracing. At the garage bay, a steel-framed storage mezzanine is suspended from the roof with round steel rods. The transmitter room and operations room have raised access tile floors at 12″ above the slab-on-grade floor.

The roofing over the major portion of the building consists of white elastomeric roofing. The roof over the galley is an inverted roof membrane system with rigid insulation over the membrane consisting of tongue and groove insulation with an integral concrete top coat. The perimeter and middle area of the roof is ballasted with concrete pavers. The windows are aluminum-insulated and include fixed, awning, and casement types. The doors are hollow metal.

### *II.a.ii. Upper Fuel Farm Building*

The Upper Fuel Farm Building is an unheated 300-square-foot building constructed in 1976. It has a conventional reinforced concrete spread footing foundation consisting of perimeter foundation wall strip footings. The floor is reinforced concrete slab-on-grade. The foundation supports 13-course, 8″-thick CMU walls. The walls support a flat reinforced concrete roof deck. The major portion of the building consists of built-up roofing. The building has no windows. The doors are hollow metal.

### *II.a.iii. Lower Fuel Farm Building*

This unheated, 300-square-foot building was constructed in 1976. It has a conventional reinforced concrete spread footing foundation consisting of perimeter foundation wall strip footings. The floor is reinforced concrete slab-on-grade. The foundation supports 13-course, 8″-thick CMU walls. The

walls support a flat reinforced concrete roof deck. The majority of the building has built-up roofing. The building has no windows. The doors are hollow metal.

### *II.a.iv. Microwave Hut*

The Microwave Hut at Tower Four is an 80-square-foot, pre-engineered fiberglass structure, approximately 8′ x 10’ in size. The date of construction is unknown. The foundation is a timber crib made from four 10’-long, 8″ x 8″, pressure-treated timbers supporting four 8′-long, 8″ x 8″, pressure-treated timbers. A two-step 48″-wide stairway provides access to a 49.5″ x 52″ landing at the hut door. The stairs and landing are made with pressure-treated 2″ x 2″ timbers. The roof is aluminum plate. There are no windows; the door is fiberglass in an aluminum frame.

### *II.a.v. Deck*

The deck is located directly in front of the south façade of the Operations Building and houses the gas grill. It is approximately 10′ x 5′. The foundation is composed of concrete footings supporting a wood deck. Six wood posts support the wood roof joists. The roofing is ribbed translucent plastic panels. The date of construction is unknown, but it looks to have been built circa 2009.

### *II.a.vi. Flammable Storage Locker (Small)*

The small flammable storage locker is a 111-square-foot, pre-fabricated steel structure built in 2004. The foundation is dry-laid concrete paver block. The locker has steel floor construction with raised fiberglass grating that is used as the floor surface. The walls and roof consist of flat steel sheet siding at the interior and exterior, and internal steel framing. The building has no windows. The doors are steel. The building houses equipment including a half-ton-capacity manually powered hoist mounted on a push trolley.

### *II.a.vii. Flammable Storage Locker (Large)*

The large flammable storage locker is a 181-square-foot, pre-fabricated steel structure built in 2004. The foundation is dry-laid concrete paver block. The locker has steel floor construction with raised fiberglass grating that is used as the floor surface. The walls and roof consist of flat steel sheet siding at the interior and exterior and internal steel framing. The building has no windows. The doors are steel.

### *II.a.viii. ATV Shed*

This 195-square-foot shed was constructed in 2001 at the exterior of the north wall of the garage bay to store all-terrain vehicles and morale equipment. The structure is partially enclosed by two walls and attached to the Operations Building at the roof and at one wall. The shed consists of pre-cast concrete prism footings supporting 4″ x 4″ timber posts, which support a double 2″ x 8″ eave. A 2″ x 8″ ledger is bolted to the exterior concrete wall of the main building. Spanning the 10′ between the ledger and

the eave beam are 2″ x 8″ rafters spaced at 36″ on-center. The rafters support flat 2″ x 4″ purlins at 33″ on-center, which support clear synthetic roof decking. The roof pitch is approximately 3 to12.. The east end of the space below the roof deck is enclosed by a timber-framed wall with plywood siding. The north edge of the space below the roof is partially enclosed by two lengths of wall under the eave beam. The west end of the space under the roof is open. The floor surface is gravel.

The exterior enclosure consists of 2″ x 4″ studs at 16″ on-center infill framing between columns with plywood siding. The roofing is ribbed translucent plastic panels. The building has no windows or doors.

### *II.a.ix. Fuel Tank Shed*

The 360-square-foot timber-framed Fuel Tank Shed is located at the west side of the Operations Building. The date of construction is unknown. The shed is 34′ x 12′ and houses a day tank. The structure is enclosed on three sides and features an open canopy on the south side. Pre-cast concrete prism footings support 4″ x 4″ timber posts. These posts support double 2″ x 8″ eave beams that in turn support 2″ x 8″ timber rafters spaced at 24″ on-center. The eave beams are spaced at 11′-6″ on-center. Roof joists are framed into the side of the eastern eave beam with galvanized steel joist hangers and bear on the west eave beam. The roof deck consists of clear synthetic panels. At the tank, there are two end walls spaced approximately 18′ apart and one side wall. The walls are framed with 2″ x 4″ timber studs and sheathed with plywood siding. The exterior enclosure consists of 2″ x 4″ studs at 16″ on-center infill framing between columns with plywood siding. The roofing is ribbed translucent plastic panels. The building has no windows. A door at each end is constructed of wood framing and plywood siding.

### *II.a.x. Morale Shed*

Ashore of the float abutment is a one-story, 64-square-foot, 8′ x 8′ timber-framed storage shed. The date of construction is unknown. The shed appears to be a kit from a local lumberyard. It is sheathed with plywood siding and has a plywood roof deck. The shed floor is a timber-framed platform with a plywood deck supported at the corners with concrete blocks. The exterior enclosure consists of plywood siding and a ribbed translucent plastic panel roof. The exterior doorway is a pair of doors also constructed out of plywood siding. The building has no windows.

### *II.a.xi. Beedy Storage Shed*

On the access road between the Operations Building and Tower Four is a 143-square-foot, timber-framed storage building constructed ca.1975. According to one crewmember, Electronic Technician Thomas Duprey, the shed was reportedly named for a former Commanding Officer. The structure is 13′-10″ x 11′-0″ and has a concrete slab-on-grade floor. It appears that the walls bear on the slab and no additional footings exist. The walls consist of 2″ x 4″ studs at 16″ on-center. Sidewalls support 2″ x 4″ rafters at 16″

spacing. The rafters frame into a 2″ x 6″ ridge beam and have horizontal 2″ x 4″ collar ties at mid-span. The rafters support ribbed translucent plastic panels. The walls consist of metal siding on the exterior. The wall bottom plate is not treated. The top of the wall top plate is 95″ above the slab. The roof slope is approximately 7.5″ on 12″ (vertical to horizontal).

The exterior enclosure consists of metal siding attached to 2″ x 4″ stud wall framing. The roofing is ribbed translucent plastic panels. The building has no windows. The exterior door consists of a pair of doors site built from 2″ x 4″ wood frames with metal siding.

### *II.a.xii. Incinerator Shed*

The Incinerator Shed is a 171-square-foot building consisting of three walls and a roof. The date of original construction is unknown. The structural system consists of a conventional concrete slab-on-grade foundation and perimeter foundation walls with strip footings supporting two rigid frames that support light gauge steel channel purlins under a metal deck. The frame columns consist of tube steel sections. Three sides of the structure are enclosed with metal siding supported by 2″ x 2.5″ timber framing.

The building roof was extended after original construction by the construction of an approximately 10′ x 10′ timber-framed roof supported by two 4″ x 4″ timber posts that are supported by pre-cast concrete prism footings. The posts are cross-braced with timber 2″ x 2.5″ braces. The extension roof framing consists of three 2″ x 2.5″ rafters that support 2″ x 2.5″ purlins, which, in turn, support the metal roof deck.

The exterior enclosure consists of wood stud framing between steel columns sheathed with metal siding. The roof over the incinerator consists of metal “V” roofing panels attached to the steel purlins. The roof over the added shed is ribbed metal attached to wood rafters. The building has no windows or doors.

### *II.a.xiii. Sewage Plant*

The 91-square-foot Sewage Plant was built in 1976 and consists of a reinforced concrete vault that serves as a foundation, galvanized steel grate floor supported by steel beams, timber stud walls, and timber roof framing. The walls and roof are sheathed with plywood. The roof is a single gable. The building is approximately 12′-8″ x 7′-0″ and 8′ tall. The exterior enclosure consists of plywood siding and corrugated metal roofing panels. The building has no windows. The door is constructed of wood framing and plywood siding.

### *II.a.xiv. Float Shoal Cove*

A timber-framed float, approximately 55′ x 14′, is moored along the shoreline approximately five miles northwest of the station buildings. The float construction consists of foam billets supporting 6″ x 6″ cross beams that, in turn, support 6″ x 6″ stringers. The cross beams are spaced at approximately 8′ on-center and are cross-braced with 6” x 6” timbers. The

foam billets are secured to the cross beams with a 3″ x 6″ sill and through bolts. A diagonally-sheathed timber deck is on top of the stringers.

The perimeter of the float has an 8″ x 8″ timber bullrail supported on scupper blocks. Light duty mooring cleats are mounted on the bullrail. The perimeter of the float below the deck is faced with rubber bumpers. The float is secured from the shore with two parallel, timber-pole struts, approximately 50′ apart that are hinged at the shore abutment and at the float's shoreward edge. The hinges are made of a welded galvanized steel plate assembly. The timber poles have steel side plates at these hinges; the plates are through-bolted to the timber poles. The timber-pole struts are laterally braced with two 1.5″ diameter galvanized steel cross bracing rods.

The float is accessed from shore by a 6′-wide x 62′-long x 4'-tall galvanized steel gangway with a timber deck. The gangway side rails serve as support trusses. The trusses are comprised of a 2-1/2″ diameter top chord rail, a 6″ steel channel bottom chord rail, and two 1″ x 4″ timber rails between them. The chords are separated by 1-1/4″ diameter vertical steel pipe at 5′ on-center and 1-1/4″ diameter steel pipe diagonals between the verticals Steel channel floor beams, 6″-wide, span between the side truss bottom chords. These floor beams are spaced at 5′ on-center and are directly below the side truss verticals. The floor beams support timber floor decking. Approximately 2′ of the gangway deck is cleated with triangular timber material that is nailed perpendicular to the decking and the direction of travel at 2′ on-center. Approximately 3′ of the deck is covered with metal mesh to aid with traction.

The gangway is supported at the shore by a hanging, double-hinge connector with steel straps connected to the abutment. At the float, the gangway is supported by skids that rest on a steel plate bolted to the float deck. The top and the base of the gangway have transition plates.

A 36′-long, cast-in-place concrete abutment supports the timber-pole struts, the gangway, and the steel cross bracing. This abutment cross-section consists of a footing 5′-6″ wide x 2′ thick and a 5′-high x 4′-wide top as measured in cross-section. The top has a 3′ diagonal chamfer. The abutment is secured by two concrete tie-backs approximately 12′ from the back and at each end of the abutment.

### *II.a.xv. Waterfront Bulkhead*

West of the Shoal Cove float, there is a 25′-wide bulkhead. The bulkhead has a top elevation of +12' Mean Lower Low Water (MLLW) and has a base elevation of approximately +1' MLLW. Sidewalls extend 16′ perpendicular to the bulkhead face and shoreline. The bulkhead walls consist of three 8″ H-piles embedded 3′ into rock and back braced with 5″ x 5″ steel L-angles bolted to the bedrock. Flat sheet pile sections are placed horizontally against and bolted to the exterior face of the H-piles. The sidewall H-piles are tied together with a 1-1/4″ diameter steel rod bolted to opposing H-piles. At the top of the bulkhead, there is a reinforced concrete cap that is 18″

wide x 14″ deep. In the top of the cap at the front wall and side wall intersection are embedded mooring rings made of a 2″ diameter bent steel rod. The bulkhead is backfilled with shot-rock fill and surfaced with crushed gravel.

### *II.a.xvi. Stringer Bridge*

The station access road that leads to the receiving antenna crosses East Shoal Creek with a log stringer bridge that was constructed in 1976. The bridge is single span, approximately 20′ long x 18′ wide. Log stringers are covered with approximately 3′ of earthen fill. The stringers appear to be 18″ to 24″ in diameter and bear on large diameter log abutments.

### *II.a.xvii. Painted Creek Bridge*

The access road that leads to the station from Shoal Cove crosses Painted Creek via a timber-decked, steel-girder bridge. This bridge was built in 2003 and is maintained by the USFS. It is used by the USCG under a letter of agreement with the USFS.

The bridge is a 122′ long single-span bridge with an 18′-wide timber deck. There are 12″ x 12″ bullrails on each side of the deck with the top of the bullrail being 20″ above the deck. The bridge structure consists of a rough-cut 4″ deck over 8″-wide GLULAM® members laid flat across the top of the steel plate girders. The girders are 78″ deep and have 8″ x 1″-thick flanges at the bridge ends. The flanges widen at mid-span. The girders are supported by a 15″-wide x 14″-deep I-beam pile cap with ½″ flanges. The pile cap is supported by pipe piles directly under the girders. There are 8″-thick concrete back walls that extend from the underside of the wear deck to the pile caps. There are no approach guardrails. Riprap has been placed to stabilize each bank under the bridge.

### *II.a.xviii. Towers*

Four 695′ guyed towers are laid out in a 1,000-linear-foot array surrounding the Operations Building. The Model 2515 (SLT) towers were built by Stainless, Inc. They are composed of galvanized steel structural members (legs, girts and diagonals) anchored by guys wires. Each tower features a ladder, safety rail, and lighting system, and is entirely painted in orange and white aviation warning paint. The base of each tower consists of a reinforced concrete foundation approximately 10′ x 10′ and 9′ thick with a fiberglass rod insulator out of which the towers rise. The four towers are connected to each other at the LORAN antenna termination base directly west of the transmitter room.

### *II.a.xix. Helipad*

The helipad is located approximately 2,000 linear feet northeast of the Operations Building and consists of a 65′ square concrete surface with a parking area.

### *II.a.xx. Beaver Pond Dam*

The Beaver Pond Dam is an earthen, manmade, rock fill dam enhanced by yearly beaver activity on Beaver Pond. The dam measures approximately 40 linear feet in width with an approximate 10′-wide spillway.

# III. Site Description (USCG 2005)

Shoal Cove is in the maritime climate zone, featuring mild winters, cool summers, and heavy precipitation, with an annual average rainfall of 130″ and snowfall of 32″. Summer temperatures range between 51°F and 65°F, while winter temperatures drop to between 29°F and 39°F. The terrain on the island is not suitable for landing airplanes; however, the station maintained both a helipad for helicopter landings and a float/dock for boat and seaplane access.

Nearby Ketchikan has regularly scheduled commercial flights to Seattle and Alaskan communities and is also accessible via the Alaska Marine Highway system.

The main facilities for the station are located five miles east of the USCG float and boat dock via a gravel road. The largest building, the Operations Building, consists of the generator room, garage, barracks, crews' area, galley, and transmitter room. Several smaller buildings surround the Operations Building including the fuel day tank to the west, the Sewage Treatment Plant to the east, and the incinerator and its fuel supply tank to the southeast. Additionally, the LORAN antenna termination base for the four towers is located directly west of the transmitter room, and the four towers are equally spaced 1,000′ from the base surrounding the Operations Building. Other utilities and infrastructure include a small deck, a water well, an underground fire protection tank, and a backwash seepage pit (USCG 2005). The helipad is located approximately 2,000′ northeast of this building and consists of a 65′ square concrete surface with a parking area.

Shoal Cove generated its own electric power to support site operations. Approximately 230,000 gallons of Arctic grade fuel oil was delivered each year by barge, stored at the Upper Fuel Tank Farm, and piped to the Operations Building where it was used for operating and heating. The Upper Fuel Tank Farm is located approximately 2,000′ east of the Operations Building and included a Fuel Transfer Building, an aboveground 3″ fuel oil line, and two 225,000-gallon aboveground storage tanks (AST), which were removed during station layaway. The abandoned Lower Fuel Farm is located approximately 400′ east of the float and boat dock and includes a Fuel Transfer Building and the remnants of the concrete containment area for the two ASTs that were removed in 2004. A storage shed is located on the roadway leading to Tower Four, and a microwave hut and receiving antenna are located at the base of this tower.

Various roadways surrounding the towers are maintained by USCG and the USFS. Beaver Pond is located approximately 100′ east of the Operations Building and exhibits an earthen dam. There is a log stringer bridge on the access road to the receiving antenna (near Tower Four), and a timber-decked, steel-girder bridge on the access road from Shoal Cove to the station where it crosses Painted Creek.

| **Architectural Description (Include setting & outbuildings):** | **Statement of Significance:** |
|---|---|
| A 195-SF shed was constructed in 2001 at the exterior of the north wall of the garage bay to store all-terrain vehicles and morale equipment. The structure is partially enclosed by two walls and attached to the Operations Building at the roof and at one wall. The shed consists of pre-cast concrete prism footings supporting 4" × 4" timber posts, which, in-turn, support a double 2" × 8" eave beam. A 2" × 8" ledger was bolted to the exterior concrete wall of the main building. 2" × 8" rafters, spaced at 36" on-center, span the 10' between the ledger and the eave beam. The rafters support flat 2" × 4 "purlins at 33" on-center, which in turn support clear synthetic roof decking. The roof slopes up from the eave at an approximate slope of 3 on 12 (vertical to horizontal). The east end of the space below the roof deck is enclosed by a timber-framed wall with plywood siding. The north edge of the space below the roof is partially enclosed by two lengths of wall under the eave beam. The west end of the space under the roof is open. The floor surface is gravel. | The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.<br>At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. The LORAN system was developed under a program of the federal government by scientists at MIT, and modeled after the British Gee system. LORAN-C provided a highly accurate, all-weather navigational system, available twenty-four hours per day. It operated as a low-frequency hyperbolic radio navigation system using the time difference in pulses from two pairs of transmitting stations to obtain a navigation fix. Operation and maintenance of LORAN stations was transferred to the U.S. Coast Guard in 1943. Stations were built throughout the U.S., Russia, Canada, Asia, and Europe eventually to provide some 70 million square miles of coverage. |
| The exterior enclosure consists of 2" x 4" studs at 16" on-center infill framing between columns with plywood siding. Roofing is ribbed translucent plastic panels. The building has no windows or doors. | The Shoal Cove LORAN-C Station was constructed in 1975 by USCG and decommissioned in 2010. The station consisted of four 695-foot guyed towers and served as a dual-rated, double secondary station, producing signals for the Gulf of Alaska and Canadian West Coast chains. The ATV Shed is a contributing feature to the Shoal Cove LORAN-C Station Historic District. |

**Architectural Description (Include setting & outbuildings):**

On the access road between the main station building and Tower 4 is a 143-SF timber-framed storage building. The date of construction is unknown. The structure is 13'-10"× 11' and has a concrete slab-on-grade floor. It appears that the walls bear on the slab and no additional footings exist. The walls consist of 2" × 4" studs at 16" on-center. Sidewalls support 2" × 4" rafters at 16" spacing. The rafters frame into a 2" × 6" ridge beam and have horizontal 2" × 4" collar ties at mid-span. The rafters support ribbed translucent plastic panels. The walls consist of metal siding on the exterior. The wall bottom plate is not treated. The pinnacle of the wall top plate is 95-inches above the slab. The roof slope is approximately 7.5 on 12 (vertical to horizontal).

The exterior enclosure consists of metal siding attached to 2" × 4" stud wall framing. The roofing is ribbed translucent plastic panels. The building has no windows.The exterior door consists of a pair of doors, site-built, of 2" × 4" wood frame with metal siding.

**Statement of Significance:**

The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.

At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. The LORAN system was developed under a program of the federal government by scientists at MIT, and modeled after the British Gee system. LORAN-C provided a highly accurate, all-weather navigational system, available twenty-four hours per day. It operated as a low-frequency hyperbolic radio navigation system using the time difference in pulses from two pairs of transmitting stations to obtain a navigation fix. Operation and maintenance of LORAN stations was transferred to the U.S. Coast Guard in 1943. Stations were built throughout the U.S., Russia, Canada, Asia, and Europe eventually to provide some 70 million square miles of coverage.

The Shoal Cove LORAN-C Station was constructed in 1975 by USCG and decommissioned in 2010. The station consisted of four 695-foot guyed towers and served as a dual-rated, double secondary station, producing signals for the Gulf of Alaska and Canadian West Coast chains. The Beedy Storage Shed is a contributing feature to the Shoal Cove LORAN-C Station Historic District.

**Architectural Description (Include setting & outbuildings):**

A timber-framed float, approximately 55' × 14', is located five miles northwest of the Operations Building. The float is constructed of foam billets supporting 6" × 6" cross beams that support 6" × 6" stringers. The cross beams are spaced at approximately 8' on-center and are cross-braced with 6" × 6" timbers. The foam billets are secured to the cross beams with a 3" x 6" sill and through bolts. A 2" x 2", diagonally-sheathed deck is on top of the stringers. The perimeter of the float has an 8" × 8" timber bullrail supported on 4" x 4" scupper blocks. Light-duty mooring cleats are mounted on the bullrail. The perimeter of the float below the deck is faced with rubber bumpers. The float is secured from the shore with two parallel timber-pole struts that are approximately 50' apart and hinged at the shore abutment and at the float's shoreward edge. The hinges are a welded, galvanized steel plate assembly. The timber-poles have steel side plates at these hinges; the plates are through bolted to the timber-poles. The timber-pole struts are laterally braced with two 1.5"-diameter galvanized steel cross-bracing rods.

The float is accessed from shore by a 6'-wide by 62'-long galvanized steel gangway with a timber deck. The gangway side rails serve as support trusses. The trusses consist of 2 1/2"-diameter top chord/rail and 6" steel channel bottom chord. The chords are separated by 1 1/4"-diameter steel pipe verticals at 5' on-center and 1 1/4" diameter steel pipe diagonals between the verticals. There are two 1" × 4" timber intermediate rails on the side trusses that limit the opening size of the side trusses. Steel channel floor beams (6") span between the side truss bottom chords. These floor beams are spaced at 5' on-center and are directly below the side truss verticals. The floor beams support 2" x 2" timber floor decking.

Approximately 2' of the gangway deck is cleated with triangular timber 2x material nailed perpendicular to the decking and direction of travel, at 2' on-center. Approximately 3' of the deck is covered with metal mesh, which aids in traction. The gangway is supported at the shore by a hanging, double-hinge connector with steel straps connected to the abutment. At the float, the gangway is supported by skids that rest on a steel plate bolted to the float deck.The top and the base of the gangway have transition plates. A 36'-long, cast-in-place concrete abutment supports the timber-pole struts, the gangway, and the steel cross bracing. This abutment cross-section consists of a 5'6" wide by 2'-thick footing and a 5'-high by 4'-wide top as measured in cross-section. The top has a 3' diagonal chamfer. The abutment is secured by two concrete deadmen approximately 12' from the back of the abutment at each end of the abutment.

**Statement of Significance:**

The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.

At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. The LORAN system was developed under a program of the federal government by scientists at MIT, and modeled after the British Gee system. LORAN-C provided a highly accurate, all-weather navigational system, available twenty-four hours per day. It operated as a low-frequency hyperbolic radio navigation system using the time difference in pulses from two pairs of transmitting stations to obtain a navigation fix. Operation and maintenance of LORAN stations was transferred to the U.S. Coast Guard in 1943. Stations were built throughout the U.S., Russia, Canada, Asia, and Europe eventually to provide some 70 million square miles of coverage.

The Shoal Cove LORAN-C Station was constructed in 1975 by the USCG and decommissioned in 2010. The station consisted of four 695-foot guyed towers and served as a dual-rated, double secondary station, producing signals for the Gulf of Alaska and Canadian West Coast chains. The Float/Dock is a contributing feature to the Shoal Cove LORAN-C Station Historic District.

**Architectural Description (Include setting & outbuildings):**

A 360-SF timber-framed hazardous fuel tank shed is located at the west side of the Operations Building. The date of construction is unknown. The fuel tank is 34’ x 12’. The structure is a partially-enclosed shed with walls on three sides and an additional open canopy on the south side. The structure consists of timber 4" × 4" posts supported by pre-cast concrete prism footings. These footings support double 2" × 8" eave beams that in turn support 2" × 8" timber rafters spaced 24” on-center. The eave beams are spaced at 11’ 6” center-to-center. Roof joists are framed into the side of the eastern eave beam with galvanized steel joist hangers and bear on the west eave beam. The roof deck consists of clear synthetic panels.

At the tank, there are two end walls spaced approximately 18’ apart and one side wall. The walls are framed with 2" × 4" timber studs and sheathed with plywood siding. The exterior enclosure consists of 2" × 4" studs at 16” on-center infill framing between columns with plywood siding. The roofing is ribbed translucent plastic panels. The building has no windows. A door at each end is constructed of wood framing and plywood siding.

|---|---|
| The incinerator shed is a 171-SF building consisting of three walls and a roof. The date of original construction is unknown. The structural system consists of a conventional concrete slab-on -grade and perimeter wall foundation. Strip footings underlay two rigid frames that support light gauge steel channel purlins that, in turn, support a metal deck. Frame columns consist of tube steel sections. Three sides of the structure are enclosed with metal siding supported on 2" x 2.5" timber framing.<br>The building roof was extended after original construction by the construction of a timber-framed roof, approximately 10' × 10' supported by two 4"× 4" timber posts that are supported on pre-cast concrete prism footings. The posts are cross-braced with timber 2" × $2^1/_2$" braces. The extension roof framing consists of three 2" × $2^1/_2$" rafters that support 2" × $2^1/_2$" purlins, which, in turn, support the metal roof deck. The exterior enclosure consists of wood stud framing between steel columns and metal siding applied vertically at walls. The roof over the incinerator is metal "V" roofing panels attached to the steel purlins. The roof over the added shed is ribbed metal roof attached to wood rafters. The building has no windows or doors. | The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. **Architectural Description (Include setting & outbuildings):**
The Flammable Storage Locker Large (LG) is a 181-SF, pre-fabricated steel structure built in 2004. The foundation is dry-laid, concrete paver-block. The locker has steel floor construction with raised fiberglass grating that is used as the floor surface. The walls and roof consist of flat steel sheet siding overlaying both sides of internal steel framing. The building has no windows. The doors are steel.

**Statement of Significance:**
The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.

At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. The LORAN system was developed under a program of the federal government by scientists at MIT, and modeled after the British Gee system. LORAN-C provided a highly accurate, all-weather navigational system, available twenty-four hours per day. It operated as a low-frequency hyperbolic radio navigation system using the time difference in pulses from two pairs of transmitting stations to obtain a navigation fix. Operation and maintenance of LORAN stations was transferred to the U.S. Coast Guard in 1943. Stations were built throughout the U.S., Russia, Canada, Asia, and Europe eventually to provide some 70 million square miles of coverage.

The Shoal Cove LORAN-C Station was constructed in 1975 by USCG and decommissioned in 2010. The station consisted of four 695-foot guyed towers and served as a dual-rated, double secondary station, producing signals for the Gulf of Alaska and Canadian West Coast chains. The Large Flammable Storage Locker is a contributing feature to the Shoal Cove LORAN-C Station Historic District.

| **Architectural Description (Include setting & outbuildings):** | **Statement of Significance:** |
|---|---|
| The Operations Building is a two-story, 18,365-square foot building with an irregular L-plan and a flat roof. The building contains the generator room, transmitter room, offices, barracks, recreation area, galley, garage, and snow plenum. It was constructed in 1975 and underwent a minor renovation of the shower rooms in 1994. The foundation of the Operations Building consists of reinforced concrete with a spread footing foundation. The ground level floors are concrete slab-on-grade. The walls are painted, textured, cast-in-place concrete. The upper floor consists of reinforced concrete beams supporting a concrete slab. Concrete bearing walls extend to the roof. The roof framing consists of open web steel joists supporting steel decks. | The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years. |
| At the generator and transmitter plenums, steel beams span between concrete bearing walls and directly support the steel deck. The walls between the generator room and the garage bay and at the entrance to the transmitter plenum are concrete masonry unit laterally supported at the roof with steel bracing. At the garage bay, there is a steel-framed storage mezzanine suspended from the roof with round steel rods. In the transmitter room and operations room there is a raised access tile floor 12” above the slab-on-grade floor. The roofing over the major portion of the building consists of white elastomeric roofing. The roof over the galley is an inverted roof membrane system with rigid insulation over the membrane consisting of tongue-and-groove insulation with an integral concrete top coat. The perimeter and middle area of the roof is ballasted with concrete pavers. Windows are aluminum-insulated and include fixed, awning, and casement types. The doors are hollow metal. | At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. The LORAN system was developed under a program of the federal government by scientists at MIT, and modeled after the British Gee system. LORAN-C provided a highly accurate, all-weather navigational system, available twenty-four hours per day. It operated as a low-frequency hyperbolic radio navigation system using the time difference in pulses from two pairs of transmitting stations to obtain a navigation fix. Operation and maintenance of LORAN stations was transferred to the U.S. Coast Guard in 1943. Stations were built throughout the U.S., Russia, Canada, Asia, and Europe eventually to provide some 70 million square miles of coverage. |
| There are four outbuildings/structures, including the Fuel Day Tank to the west, the Sewage Treatment Plant to the east, the incinerator and its fuel supply tank to the southeast, and the wood deck directly in front of the main entry. Additionally, the LORAN antenna termination base for the four towers is located directly west of the transmitter room, and the four towers are equally spaced 1,000' from this base surrounding the Operations Building. | The Shoal Cove LORAN-C Station was constructed in 1975 by USCG and decommissioned in 2010. The station consisted of four 695-foot guyed towers and served as a dual-rated, double-secondary station, producing signals for the Gulf of Alaska and Canadian West Coast chains. The Main Building is a contributing feature to the Shoal Cove LORAN-C Station Historic District. |

**Architectural Description (Include setting & outbuildings):**
The Microwave Hut at Tower 4 is an 80-square-foot, pre-engineered fiberglass structure that measures approximately 8' × 10'. The date of construction is unknown. The foundation is a timber crib made from four 10' × 8" × 8" pressure-treated timbers supporting four 8' × 8" × 8" pressure-treated timbers. A two-step 48"-wide stairway provides access to a 49 1/2" x 52" landing at the hut door. The stairs and landing are made with pressure-treated 2" × 2" timbers. The roof is aluminum plate. There are no windows; the door is fiberglass in an aluminum frame.

**Statement of Significance:**
The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.

At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. The LORAN system was developed under a program of the federal government by scientists at MIT, and modeled after the British Gee system. LORAN-C provided a highly accurate, all-weather navigational system, available twenty-four hours per day. It operated as a low-frequency hyperbolic radio navigation system using the time difference in pulses from two pairs of transmitting stations to obtain a navigation fix. Operation and maintenance of LORAN stations was transferred to the U.S. Coast Guard in 1943. Stations were built throughout the U.S., Russia, Canada, Asia, and Europe eventually to provide some 70 million square miles of coverage.

The Shoal Cove LORAN-C Station was constructed in 1975 by the USCG and decommissioned in 2010. The station consisted of four 695-foot guyed towers and served as a dual-rated, double secondary station, producing signals for the Gulf of Alaska and Canadian West Coast chains. The Microwave Hut is a contributing feature to the Shoal Cove LORAN-C Station Historic District.

**Architectural Description (Include setting & outbuildings):**
Ashore of the float abutment is a one-story, 64-square-foot, 8'× 8' timber framed storage shed. The date of construction is unknown. The shed appears to be a kit from a local lumberyard. It is sheathed with plywood siding and has a plywood roof deck. The shed floor is a timber-framed platform with plywood deck supported at the corners with concrete blocks. The exterior enclosure consists of plywood siding with a shingled roof. The exterior door consists of a pair of doors also constructed out of plywood siding. The building has no windows.

**Statement of Significance:**
The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.

At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. The LORAN system was developed under a program of the federal government by scientists at MIT, and modeled after the British Gee system. LORAN-C provided a highly accurate, all-weather navigational system, available twenty-four hours per day. It operated as a low-frequency hyperbolic radio navigation system using the time difference in pulses from two pairs of transmitting stations to obtain a navigation fix. Operation and maintenance of LORAN stations was transferred to the U.S. Coast Guard in 1943. Stations were built throughout the U.S., Russia, Canada, Asia, and Europe eventually to provide some 70 million square miles of coverage.

The Shoal Cove LORAN-C Station was constructed in 1975 by the USCG and decommissioned in 2010. The station consisted of four 695-foot guyed towers and served as a dual-rated, double secondary station, producing signals for the Gulf of Alaska and Canadian West Coast chains. The Morale Shed is a contributing feature to the Shoal Cove LORAN-C Station Historic District.

**Architectural Description (Include setting & outbuildings):**

The access road that leads to the LORAN-C station from Shoal Cove crosses Painted Creek via a timber-decked, steel-girder bridge. This bridge was built in 2003 and is maintained by the USFS. It is used by the USCG under a letter of agreement with the USFS. The bridge is single-span, 122' long, with an 18'-wide timber deck. There are 12" × 12" bullrails on each side of the deck with the top of the bullrail 20" above the deck.

The bridge structure consists of a rough-cut 4" deck over 8"-wide glu lam members laid flat across the top of the steel plate girders. The girders are 78" deep and have 8" × 1"-thick flanges at the bridge ends. The flanges widen mid-span. The girders are supported by a 15"-wide by 14"-deep I-beam pile cap with ½" flanges. The pile cap is supported by pipe piles directly under the girders. There are 8"-thick concrete block walls that extend from the underside of the wear deck to the pile caps. There are no approach guardrails. There is riprap placed on each bank under the bridge.

**Statement of Significance:**

The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.

At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. **Architectural Description (Include setting & outbuildings):**
The LORAN-C station at Shoal Cove exhibited four 695-foot guyed towers laid out in a 1,000-foot array surrounding the Operations Building. The towers were built by Stainless, Inc., Model 2515 (SLT). They are composed of galvanized steel structural members (legs, girts and diagonals) anchored by guy wires (some copper). The towers feature a ladder, safety rail, and lighting system, and are entirely painted in orange and white aviation warning paint. The base of the towers consists of a reinforced concrete foundation, approximately 10' long x 10' wide x 9' tall with fiberglass rod insulator, out of which the tower rises. The four towers are connected to each other at the LORAN antenna termination base directly west of the transmitter room.

**Statement of Significance:**
The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. **Architectural Description (Include setting & outbuildings):**

The Upper Tank Farm has a concrete-lined secondary containment area for the single-wall above ground fuel tanks. This containment area is approximately 8,778 SF and provides 9,532 barrels of containment volume. It was constructed in 1976. The containment area was excavated out of bedrock and covered with a granular leveling course topped with 3" of concrete. The fuel tanks sat within concrete rings in the containment area, but have since been removed as part of the building layaway plan. The containment area has an upper and lower area. The upper area is approximately 7,172 SF and is approximately 5' deep. There are approximately 268' of walls around the perimeter of the upper area. The lower area is approximately 1,605 SF and is approximately 11' deep. On one side of this lower area is an 11'-6" tall, 12"-thick, 21'-long concrete wall.

Rainfall and other liquids trapped in the containment area drain from the upper area to the lower area. The lower area has a 12" corrugated metal pipe drain that is controlled by an 8" gate valve. The valve stem is accessed by a galvanized steel grate platform that is supported by the concrete wall. The valve is normally closed where contained liquids are monitored. Contaminants are removed prior to valve opening. The pipe drain empties into a natural drainage. Fuel piping within the containment area is supported on steel supports. Steel access stairs provide access into the upper level of the containment area from the surrounding ground level. The surrounding ground level is higher than the containment area.

**Statement of Significance:**

The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. The station is also eligible under Criterion Consideration G as a property of exceptional importance that has achieved significance within the past fifty years.

At the beginning of WWII, positioning was done using dead reckoning, celestial navigation, and later, radio beacon. As state and federal responsibility for providing navigational aids increased, the development of a more accurate system was needed. The LORAN system was developed under a program of the federal government by scientists at MIT, and modeled after the British Gee system. LORAN-C provided a highly accurate, all-weather navigational system, available twenty-four hours per day. It operated as a low-frequency hyperbolic radio navigation system using the time difference in pulses from two pairs of transmitting stations to obtain a navigation fix. Operation and maintenance of LORAN stations was transferred to the U.S. Coast Guard in 1943. Stations were built throughout the U.S., Russia, Canada, Asia, and Europe eventually to provide some 70 million square miles of coverage.

The Shoal Cove LORAN-C Station was constructed in 1975 by USCG and decommissioned in 2010. The station consisted of four 695-foot guyed towers and served as a dual-rated, double secondary station, producing signals for the Gulf of Alaska and Canadian West Coast chains. The upper fuel tank containment area is a contributing feature to the Shoal Cove LORAN-C Station Historic District; however, the fuel tanks have been removed.

| **Architectural Description (Include setting & outbuildings):** | **Statement of Significance:** |
|---|---|
| West of the Shoal Cove float, there is a 25'-wide bulkhead. The bulkhead has a top elevation of +12' Mean Lower Low Water (MLLW) and has a base elevation of approximately +1' MLLW. Sidewalls extend 16-feet perpendicular to the bulkhead face and shoreline. The bulkhead walls consist of three 8" H-piles embedded 3' into rock and back braced with 5" × 5" L steel angles bolted to the bedrock. Flat sheet pile sections are placed horizontally against the exterior face of the H-piles and bolted to the H-pile flanges. Sidewall H-piles are tied together with a $1\frac{1}{4}$"-diameter steel rod bolted to opposing H-piles. At the top of the bulkhead, there is an 18" wide× 14" deep reinforced concrete cap. In to the top of the cap at the front wall and side wall intersection are embedded 2" diameter bent steel rod mooring rings. The bulkhead is backfilled with shot-rock fill and surfaced with crushed gravel. | The LORAN-C Station at Shoal Cove is eligible as an historic district under Criterion A, at the national level of significance, for its role as an historic aid to navigation within the Gulf of Alaska. Long-Range Aid to Navigation (LORAN) was the federally-provided radio navigation system for maritime and some aviation activity from approximately 1940 to 2010. # ARCHITECTURAL DRAWINGS

## GENERAL NOTES

1. REFER TO SHEET C-2 FOR APPROXIMATE TOWER LAYOUT.
2. THE EXACT HORIZONTAL AND VERTICAL POSITION OF GUY AND STRUCTURAL ANCHORS TO BE GIVEN BY THE TOWER FABRICATOR AND SHOWN ON THE TOWER ERECTION DRAWINGS
3. ADDITIONAL MASS WASTING SITES TO BE FIELD LOCATED WITHIN THE COAST GUARD BOUNDRY BY CONTRACTOR AND APPROVED BY THE ENGINEER.
4. EROSION CONTROL PLAN TO BE SUBMITTED FOR APPROVAL PRIOR TO LAND CLEARING.
5. CONTRACTOR'S CAMP FACILITIES AND STORAGE AREA SHALL BE LOCATED OUTSIDE OF THE ANTENNA GROUND SYSTEM AREA, UNLESS OTHERWISE APPROVED.
6. THE AREA DESIGNATED "MASS WASTING AREA" SHALL BE NO MORE THAN THREE FEET ABOVE THE ADJACENT ROAD LEVEL.
7. ALL MASS WASTING AREAS SHALL BE RESTORED TO BLEND WITH SURROUNDING TERRAIN. NO PROTRUDING LOGS, BRUSH, ETC. WITH TOP SURFACE BACK BLADED SMOOTH AND SEEDED.
8. ALL STAGING AREAS MUST BE RESTORED BY BACK BLADING SMOOTH, PLACEMENT OF 3-INCH MINIMUM LAYER OF NATIVE TOP SOIL AND SEEDED.

GENERAL NOTES

1. THESE ARE A & E DESIGN DRAWINGS AND DETAILING BY THE FABRICATOR SHALL BE SUBJECT TO APPROVAL BY THE ENGINEER.
2. DURING DETAILING OF THE STRUCTURES EXACT DIMENSIONS AND ANGLES SHALL BE DETERMINED BY THE FABRICATOR.
3. IT IS REQUIRED THAT THE FABRICATOR SHALL DETAIL AND FABRICATE THE STRUCTURES IN SUCH A WAY THAT JOINT ECCENTRICITIES ARE VIRTUALLY ELIMINATED.
4. ALL STEEL FIELD CONNECTIONS SHALL USE TWO BOLTS AS MINIMUM. THE DISTANCE FROM THE CENTER OF A BOLT TO THE FACE OF THE OUTSTANDING LEG OF AN ANGLE SHALL BE SUCH AS TO PERMIT THE USE OF A SOCKET WRENCH IN TIGHTENING THE BOLT.
5. WHERE FILLS ARE REQUIRED AT TWO OR MORE ADJACENT HOLES, A SINGLE-PLATE FILL SHALL BE USED INSTEAD OF RING FILLS.
6. ALL DOUBLE-ANGLE MEMBERS SHALL BE CONNECTED AT INTERVALS BETWEEN THE END CONNECTIONS BY STITCH BOLTS ½ INCH IN DIAMETER AND WASHERS.
7. SIZE AND TYPE OF BOLTS SPECIFIED FOR EACH CONNECTION SHALL NOT BE SUBSTITUTED WITHOUT APPROVAL OF THE ENGINEER. THE DETERMINATION OF BOLT LENGTHS IS THE RESPONSIBILITY OF THE FABRICATOR.
8. THE MINIMUM SIZE OF WELD ALLOWED IS 3/16". THE DETERMINATION OF THE WELD SIZE, IN ACCORDANCE WITH THE WELD TYPE INDICATED ON THE DRAWINGS TO DEVELOP THE FULL STRENGTH OF THE CONNECTED MEMBERS, IS THE RESPONSIBILITY OF THE FABRICATOR, UNLESS OTHERWISE NOTED.
9. ALL DIMENSIONS ON THE DRAWINGS ARE TO MEMBER CENTROIDS OR TO WORKING POINTS (INTERSECTION OF CENTROIDS), EXCEPT AS NOTED.
10. ALL STEEL MEMBERS SHALL BE OF ASTM-A36 STEEL, UNLESS OTHERWISE NOTED ON THE DRAWINGS.
11. ALL STEEL FIELD CONNECTIONS SHALL BE MADE BY ASTM-A325 HIGH STRENGTH BOLTS WITH ANCO LOCK NUTS AND THE BOLTS SHALL BE INSTALLED BY THE TURN-OF-THE-NUT METHOD, UNLESS OTHERWISE NOTED ON THE DRAWINGS OR ERECTION MANUAL.
12. ALL ALUMINUM SHAPES SHALL BE OF 6061-T6 ALUMINUM.
13. ALL STRUCTURAL STEEL SHALL BE HOT DIP GALVANIZED AFTER FABRICATION IN ACCORDANCE WITH ASTM SPEC. A123 . ALL BOLTS, NUTS AND OTHER HARDWARE, EXCEPT SWAGE COMPRESSION SLEEVES SHALL BE HOT DIP GALVANIZED IN ACCORDANCE WITH ASTM SPEC. A153 .
14. WASHERS AND COTTER PINS IN CABLE HARDWARE SHALL BE STAINLESS STEEL, TYPE 304.
15. ALL CABLES SHALL BE ALUMOWELD STRAND, UNLESS OTHERWISE NOTED ON THE DRAWINGS.
16. PREFORMED GUY GRIPS SHALL BE ALUMOWELD WITH SAME LAY AS CABLE.
17. ALL INSULATORS SHALL BE AS INDICATED ON THE DRAWINGS.
18. TOWERS TO BE LIGHTED IN ACCORDANCE WITH FAA ADVISORY CIRCULARS, AC 70/7460-1D AND AC150/5345-43B.
19. EACH TOWER LADDER SHALL BE EQUIPPED WITH A CLIMBING SAFETY DEVICE IN ACCORDANCE WITH TYPE 1 OF FEDERAL SPECIFICATION RR-S-001301.
20. LAYING OUT:
    A. HOLE CENTERS MAY BE CENTER PUNCHED AND CUTOFF LINES MAY BE PUNCHED OR SCRIBED. CENTER PUNCHING AND SCRIBING SHALL NOT BE USED WHERE SUCH MARKS WOULD REMAIN ON FABRICATED MATERIAL.
21. CUTTING:
    A. RE-ENTRANT CUTS SHALL BE AVOIDED WHEREVER POSSIBLE. IF USED, THEY SHALL BE FILLETED BY DRILLING PRIOR TO CUTTING.
    B. OXYGEN CUTTING OF ALUMINUM ALLOYS IS NOT PERMITTED.
22. HEATING:
    STRUCTURAL MATERIAL SHALL NOT BE HEATED FOR STRAIGHTENING.
23. REAMING:
    A. IF ANY HOLES MUST BE ENLARGED TO ADMIT THE BOLTS, THEY SHALL BE REAMED. POOR MATCHING OF HOLES SHALL BE CAUSE FOR REJECTION. HOLES SHALL NOT BE DRIFTED IN SUCH A MANNER AS TO DISTORT THE METAL. ALL CHIPS LODGED BETWEEN CONTACTING SURFACES SHALL BE REMOVED BEFORE ASSEMBLY.
24. AFTER SHOP INSPECTION, ALL STEEL SHALL BE CLEANED OF RUST, LOOSE MILL SCALE, DIRT, OIL, GREASE AND BURRS.
25. WELDING:
    A. STEEL IN ACCORDANCE WITH THE LATEST AMERICAN WELDING SOCIETY SPECIFICATIONS FOR ARC AND GAS WELDING.
26. DIAGONALS SHALL BE DETAILED IN A MANNER TO DEVELOP TENSION AND PREVENT SAGGING.
27. EQUIVALENT MATERIAL AND TECHNIQUES SHALL BE APPROVED BY THE ENGINEER.
28. STEEL DETAILING AND FABRICATION SHALL BE IN ACCORDANCE WITH AISC MANUAL OF STEEL CONSTRUCTION 7TH EDITION.
